Concepción, Diciembre de 2010.

Campaña de invierno, julio 2010

Esta campaña de mediciones hidrográficas en el fiordo de Aysén se realizó entre el 20 y 25 de julio del 2010. Se hicieron 60 perfiles con un CTD Seabird 25 (SN: 0457), el que constaba con sensor de presión, temperatura, conductividad, oxígeno y fluorescencia (Tabla 1). La configuración del CTD se muestra en la Tabla 2. Además, con el fin de medir salinidad superficial, se tomaron muestras de agua en diferentes estaciones a lo largo del fiordo (Tabla 5).

Las mediciones incluyeron una transecta a lo largo del fiordo (19 estaciones), y 2 transectas perpendiculares al eje del fiordo de 3 estaciones cada una, realizada cerca de los ríos Cóndor y Cuervo (Tabla 1 y Figura 1). Estas ultimas secciones corresponden a estaciones yo-yo.

Protocolo de medición

El protocolo utilizado para realizar los perfiles de CTD SBE 0437, fue el siguiente:

1. Se observaba la superficie del mar, para evitar contaminar la celda de conductividad con aceite u otra sustancia ajena al agua de mar.
2. El equipo se encendía en cubierta y se mantenía por aproximadamente 1 minuto a la espera que la bomba encendiera.
3. Se estabilizaba por un minuto en el agua, lo más cercano a la superficie y confirmando que el equipo quedara siempre bajo el agua.
4. Se procedía a realizar el perfil hasta la profundidad deseada virándolo inmediatamente una vez que se alcanzaba la profundidad.
5. Una vez en cubierta se apagaba inmediatamente.
6. La profundidad era estimada en base a marcas efectuadas en la cuerda.

Procesamiento de datos

El procesamiento de los datos se realizó en dos etapas, la primera, utilizando las rutinas propuestas por el fabricante de CTD SeaBird modelo 25, con el software SBE Data Processing de SeaBird, y en la segunda etapa, se usó el programa Matlab.

A continuación, se describen los módulos del primer programa utilizado:

DATA CONVERSION: Convierte los datos originales en formato hexadecimal a formato ASCII y en unidades de ingeniería. Las variables de salida fueron presión, temperatura, conductividad, concentración de oxígeno y fluorescencia (en Volts).

SECTION: Se seleccionaron los datos correspondientes a la bajada y subida del CTD, eliminando los datos correspondientes al periodo de estabilización de los sensores.

WILL EDIT: Marca como malos los datos escapados, en base a la desviación estándar de un bloque de 20 datos. Este módulo se aplicó tres veces para cada perfil y los datos marcados fueron eliminados.

FILTER: Este módulo es un filtro de paso bajo que se aplica sobre una o más columnas de datos, así cumple el rol de suavizar las altas frecuencias (cambios rápidos). Para producir cero desfase, el filtro es aplicado hacia adelante y hacia atrás a través de los datos, utilizando constantes de tiempo típicas recomendadas por el fabricante, de 0.5 s para la presión y 0.1 s para la temperatura y conductividad.

ALIGN CTD: Alinea en el tiempo las observaciones de los demás sensores respecto al sensor de presión, intentando que los datos obtenidos correspondan a la misma parcela de agua. En la campaña de primavera para medir el fiordo Aysén, se aplicó un rezago de 0.1 s para el sensor de conductividad, entre 5.0-6.0 s para el de fluorescencia, y 3.0-6.0 s para el sensor de oxígeno.

CELL THERMAL MASS: Remueve el efecto de la “masa termal de la celda” de las mediciones de conductividad. Esta corrige las pequeñas diferencias de conductividad producidos por fuertes cambios de temperatura. Los valores utilizados corresponden a los recomendados por el fabricante ($\text{Alpha}=0.004$ y $1/\beta=8$).

Posteriormente se verificó que efectivamente se eliminaron estas variaciones graficando los perfiles de conductividad y temperatura, eliminando datos donde aún se presentaron valores de conductividad anómalos (spikes) en puntos de fuertes gradientes de temperatura.

WINDOW FILTER: Este módulo filtra los datos, el cual calcula un valor promedio, tomando en cuenta los valores de datos alrededor de un punto central. El tamaño de la ventana utilizado fue de 5 puntos. Se utilizó el filtro mediana.

DERIVE: Permite derivar distintas variables. En este caso se derivaron las variables de salinidad, Sigma-t y oxígeno disuelto (usando una ventana de 2 s para el cálculo de la concentración de oxígeno, valor por defecto).

BIN AVERAGE: Este programa permite promediar los datos a intervalos elegidos por el usuario en función de la presión. El valor utilizado en este caso fue de 1 dbar. Note que la escala total para el sensor de presión es 1000 m con una precisión de 0.1% (1m) y una resolución de 0.015% (0.15m).

SPLIT: Separa los datos de subida y bajada, en archivos diferentes.

En la segunda etapa del procesamiento, se utilizó el software Matlab donde se eliminaron las inversiones de densidad (valores menores a 0 kg m^{-3}). Además con este software se realizaron las gráficas y se extrajeron algunos datos representativos de cada perfil (temperatura, salinidad, sigma-t, oxígeno y fluorescencia).

Tablas

Tabla 1. Números de serie y fecha de calibración en sensores de CTD (SBE 0457).

Sensores	Número de serie	Fecha de calibración
Temperatura	5047	26-11-2008
Conductividad	3489	07-11-2008
Presión	0664	16-12-2008
Oxígeno	1520	09-12-2008
Fluorómetro	1311	18-11-2008

Tabla 2. Configuración de CTD (SBE 0457).

Variable	Configuración
Scans por segundo	8
Frecuencia mínima de conductividad para el encendido de la bomba	0
Encendido de la bomba	45 s
Tipo de batería	Alcalinas
Voltajes externos	2

Tabla 3. Resumen de estaciones en Fiordo Aysén, campaña de invierno (Julio - 2010): nombre del archivo (perfil n°cast n°), L.C. (Longitud del Cable).
